# **Magnet**

A magnet is an object that has a magnetic field. It can be in the form of a permanent magnet or an electromagnet.

**W** Magnet

#### **Matrix**

Wikipedea article
Main article available to MERG Members only.

# **Memory Wire**

Wire made from a special alloy which changes its molecular structure at a certain temperature causing it to shrink. This effect can usefully be applied to point and signal actuation. Some types require a tension spring to pull it back to its original length while others will return unaided, although a spring is still required to keep the wire tight, it can only pull when shrinking, it cannot push. ### **Microprocessor**

A microprocessor (sometimes abbreviated  $\mu P$ ) is a programmable digital electronic component that incorporates the functions of a central processing unit (CPU) on a single semiconducting integrated circuit (IC).

w Microprocessor

#### Mobile decoder

A DCC decoder intended for fitting in a loco.

#### **Modulation**

Is the process of superimposing information onto a pure sine wave (Carrier wave), this process can be

achieved by any of fourmethods, amplitude (AM), frequency (FM), Phase (PM) or Pulse (PAM, PWM, or PPM)

#### **MOMS**

MERG Online Membership System - MERG's membership management system - used by Members to manage their contact details and renew membership and by the Membership Secretary for

administration purposes. Available via the MERG Forum

Membership, Digest & Renewal

#### **Monostable**

An electronic circuit that has a single (mono) stable state and an unstable state, an input will cause the circuit to assume the unstable state, when the input signal is removed and after a predictable delay the circuit will return to the stable state. This behaviour is the basis of most timer circuits.

#### **MOSFET**

metal-oxide-semiconductor field-effect transistor w MOSFET

# Multiplexor

A communications device that multiplexes (combines) several signals for transmission over a single medium. A demultiplexor completes the process by separating multiplexed signals from a transmission line. Frequently a multiplexor and demultiplexor are combined into a single device capable of processing both outgoing and incoming signals.

A multiplexor is sometimes called a mux and also spelled as multiplexer.
